

Instructions on how to simulate DFBA models in iBioSim

1. Once you have a model created or imported, right-click on the top-level SBML file and select Create Analysis View.

2. The analysis view will open up when created. If you already have an analysis view, you should see an arrow next to the top-level SBML file. You can click on the arrow and you will be able to see an option for the analysis view.

3. In the analysis view panel, you should select Monte Carlo in the Analysis Type and the Mixed-Hierarchical for Possible Simulators/Analyzers. Enter the desired simulation options.
4. Click on the run button to simulate the model on the menu bar.

5. Under TSD Graph, you can select the variables to plot by double-clicking on the plot frame.
